PRODUCT REQUIREMENTS DOCUMENT

Shree Banarasi Sarees Invoicing & Billing App

A lightweight, mobile-friendly React web app for creating accurate customer invoices for an Indian saree retail store.

Project	Details
Store	Shree Banarasi Sarees (■■■■ ■■■■■■ ■■■■■■■■)
Business location	Rudauli Chowk, Harpur Ailoth, Samastipur, Bihar, India
Primary users	Owner / cashier / authorized store staff
Platform	React web app; optimized for laptop, tablet and mobile
Document version	1.0 — 13 October 2026
Design direction	Premium, minimal ivory/cream, maroon and subtle gold accents

Build objective

Build a fast, dependable billing tool for in-store saree sales. Staff should be able to select products, enter customer details, apply item-level or bill-level discounts, calculate GST correctly using configured tax settings, generate a professional GST/non-GST invoice, print it or save/share it as a PDF, and preserve a searchable invoice history.

Important tax note: Treat GST rates, HSN mapping, invoice fields and tax behaviour as configurable settings. Do not hardcode assumptions into the UI. Before production use, the store owner/accountant must verify the store's GST registration status, applicable saree/product classifications and rates, and current invoice requirements.

1. Executive Summary

The app is an internal point-of-sale invoicing tool, not a full e-commerce system. Its core job is to turn a basket of sarees into a clear, legally appropriate invoice in as few steps as possible. It should feel like a polished billing counter tool: fast search, keyboard-friendly entry, large totals, minimal clicks, and reliable PDF/print output.

Success criteria

- Create a typical invoice in under 60 seconds once products are available in the catalogue.
- Calculate line totals, discounts, taxable value, GST components and final payable amount consistently to paise-level rounding rules.
- Support both registered-GST invoice mode and non-GST retail bill mode, based on business configuration.
- Generate a clean A4 print layout and a downloadable PDF that looks correct in Chrome.
- Work well on a low-powered laptop and mobile browser, with minimal dependencies and no unnecessary animations.

2. Scope and Non-Goals

MVP — must build

- Store profile and invoice settings.
- Product catalogue with saree-specific details, HSN/SAC field, GST rate, price, stock reference and SKU/barcode.
- Customer details and optional saved customer list.
- Invoice creation with product search, quantity, price, discounts, tax calculation and payment status.
- Invoice numbering, saved invoice history, search, view, print and PDF export.
- Draft handling and protection against accidental duplicate invoice creation.
- CSV import/export for products and invoice records where practical.

Not in MVP

- Full accounting, e-way bill generation, e-invoicing/IRN submission, GST return filing or direct government portal integration.
- Online payments, customer login, delivery tracking, multi-branch management or a complex ERP.
- Automatic legal/tax advice. The app calculates from configured values; it does not decide legal classification.

3. Users and Core Workflow

User	Needs
Owner / admin	Configure store and GST details, tax defaults, invoice sequence, catalogue, backups and staff access.
Cashier / staff	Quickly create invoices, find products, add customer details, apply authorized discounts, collect payment and print/share invoice.

Primary workflow

Open New Invoice → search/select saree → set quantity/price/discount if permitted → add or select customer → confirm GST treatment → review totals → choose payment mode/status → Save & Generate Invoice → Print / Download PDF / Share PDF → invoice appears in history.

4. Information Architecture

Screen	Purpose / key elements
Dashboard	Today’s sales, invoice count, paid/unpaid totals, quick New Invoice action, recent invoices. Keep KPIs compact.
New Invoice	Invoice metadata, customer, searchable product picker, editable line items, discount controls, tax summary, payment section and prominent final total.
Invoice Preview	Formal invoice document with seller/customer information, item table, tax breakup, total in figures and words, payment details, notes and signature area.
Invoice History	Search by invoice number/customer/phone/date; filter by status; open, print, PDF, duplicate as new draft, or record payment.
Products	Search, add/edit product, HSN, category, fabric, SKU/barcode, selling price, default discount, tax rate and optional stock count.
Customers	Name, phone, billing address, state, GSTIN if applicable, notes and invoice history.
Settings	Business identity, GSTIN/state/POS, invoice prefix/sequence, tax defaults, rounding, payment methods, footer and backup/export.

5. Invoice Data Requirements

Seller / store profile

- Legal/trade name; logo; full address; state name and state code; phone/email; GSTIN (optional until configured); invoice footer.
- GST registration status: Registered / Unregistered. The app must not imply that an unregistered seller can issue a tax invoice charging GST.
- Default invoice type and numbering prefix, e.g. SBS/2026-27/0001 (configurable), with a unique, sequential number for each finalized invoice.
- Financial year or numbering-period settings; finalized invoice numbers must not be silently reused.

Customer fields

- Customer name; phone (optional for walk-in); billing address; state; GSTIN and business name when applicable; optional shipping/delivery address.
- For a walk-in customer, allow a configurable simplified customer record where legally appropriate.

Saree/product fields

Field	Requirement
Product name	Required; e.g. Banarasi Silk Saree
SKU / barcode	Optional but searchable; barcode scanner input should work as keyboard input.
Category / fabric / colour	Optional, helpful for product search and store records.
HSN code	Configurable per product; validate format and required digits based on current rules and business applicability.
Unit	Default ‘Nos’ / piece; configurable where needed.
Selling price	Store price; clarify whether price is tax-inclusive or tax-exclusive in settings and display this clearly.
GST rate	Configurable per product from an admin-maintained list; do not assume one universal rate for every saree.
Stock	Optional in MVP; if enabled, warn on insufficient stock and decrement only after invoice finalization.

Invoice line item fields

- Description, HSN, quantity, unit, unit price, discount type/value, taxable value, GST rate, tax amount and line total.
- Allow percentage or fixed-amount discount; prevent negative prices/taxable values and cap discounts to valid limits.
- Support item-level discounts and an optional bill-level discount. Allocate bill-level discount proportionally across taxable lines before calculating tax, using a documented rounding method.

6. Indian GST Invoice Behaviour

Implement tax behaviour as explicit, testable rules driven by seller registration and configured place-of-supply details. Tax settings must be reviewed by the store’s accountant before use.

- When seller is configured as GST-registered and the transaction is a taxable supply, generate a tax invoice with configured GSTIN and required invoice particulars.
- When seller is unregistered, provide a retail bill/cash memo mode that does not charge or present GST as tax collected. Avoid labels that misrepresent the seller's registration status.
- For intra-state supplies, show CGST and SGST/UTGST components according to configured tax treatment. For inter-state supplies, show IGST when applicable. Determine this using seller state and place-of-supply/customer shipping details as appropriate to the transaction; do not infer solely from phone number.
- Show seller GSTIN, unique invoice number, invoice date, recipient details where required, HSN, item description, quantity/unit, taxable value, discount, applicable tax rate and tax amount, place of supply when relevant, and total amount.

- Support multiple tax rates within one invoice and display a rate-wise tax summary.
- If a product's tax rate or HSN is missing, show a visible validation warning and require an authorized user to resolve it before finalizing a GST invoice.
- Round final payable total using a configurable and documented rule; display any round-off separately rather than silently changing line calculations.
- Show total invoice value in figures and words. Make the words output locale-aware (Indian numbering format, e.g. lakh/crore) and test it thoroughly.
- Include optional reverse-charge indicator, place-of-supply, delivery address and authorised-signatory section where applicable/configured.

Compliance guardrail

Do not hardcode HSN digit length, a GST rate for ‘sarees’, a threshold, e-invoicing eligibility, or e-way bill requirements. These can depend on current law, turnover, product classification and transaction facts. Store the selected values and make them editable by an authorized admin; include a Settings notice that the owner must verify them with a GST professional.

7. Calculation Rules

Use decimal-safe arithmetic (integer paise or a decimal library) rather than relying on binary floating-point for money. Store monetary values to two decimal places and define the rounding point consistently.

Step	Rule
Gross line value	Quantity × unit price.
Item discount	Apply configured fixed or percentage discount; reject discount above eligible line value.
Taxable line value	Gross line value – item discount – allocated bill-level discount (where applicable), subject to configured tax-inclusive/exclusive pricing model.
GST	Taxable value × configured rate, split into CGST + SGST/UTGST or IGST as applicable.
Line total	Taxable value + tax for tax-exclusive pricing; tax-inclusive pricing must back-calculate taxable value and tax correctly.
Invoice total	Sum line totals –/■ explicitly shown adjustments, plus shipping/other charges if enabled and tax-treated correctly.
Balance due	Invoice total – payments recorded.

Required calculation test cases

- One item, no discount; one item with percentage discount; fixed discount; mixed GST rates; multiple quantities; tax-inclusive and tax-exclusive pricing.
- Intra-state CGST/SGST; inter-state IGST; exempt/nil-rated/non-taxable item settings where applicable and approved.
- Bill-level discount across items with different rates; paise rounding; round-off; partial payment; fully paid invoice; zero/invalid quantity; discount greater than line value.
- Verify that the same invoice preview, PDF, history total and dashboard sales total always agree.

8. Invoice PDF / Print Design

- A4 portrait, print-friendly, white/ivory base with maroon headings and restrained gold accents. Avoid large backgrounds that waste ink.
- Use the uploaded store logo rather than recreating the logo as text. Keep typography clean and legible; ensure rupee symbol renders reliably.
- Header: logo, store name, address, contact, GSTIN if configured, invoice title/type, invoice number and date.
- Bill-to/ship-to section; item table with description, HSN, quantity, rate, discount, taxable value, GST rate and tax, amount.
- Tax summary split by rate and component; subtotal, discount, shipping/charges if any, round-off, grand total, amount in words, payment mode/status, notes and signature area.
- Use repeating table headers if the invoice spans pages; prevent totals from being split away from the summary; add page numbers on multi-page invoices.
- Provide actions: Print, Download PDF, Share PDF via the device’s share sheet when supported, and Copy invoice number. Do not require a paid PDF API.

9. UX / Visual Design

- React SPA with lightweight routing; responsive from 360px mobile width to desktop. Optimize the invoice creation screen for laptop/tablet billing-counter use.
- Premium traditional Indian retail identity: ivory/cream background, deep maroon primary, subtle gold highlights, dark readable text. Do not use gradients, glassmorphism, AI-looking blobs or excessive rounded KPI cards.
- Desktop: compact sidebar/top navigation, broad invoice workspace and a sticky totals panel. Mobile: single-column flow, large touch targets, collapsible product list and a persistent total/action area.
- Keyboard-friendly product search and quantity/discount editing; sensible focus order; visible validation; confirmation before deleting lines or voiding a finalized invoice.

- Use loading, empty, success and error states. Show autosave/draft status where applicable. Do not show fake sales metrics or sample customer data in production.

10. Recommended Technical Approach

Layer	Recommendation
Frontend	React + Vite for a small, fast SPA; TypeScript recommended for tax and invoice data safety.
UI	Existing component library if already used, or a small accessible component set; avoid a heavy UI dependency stack.
Forms / validation	React Hook Form + Zod (or equivalent) for schemas and validation.
Money calculations	Pure tested calculation module using integer paise or decimal arithmetic. UI must not own tax logic.
PDF / print	HTML invoice template with print CSS; browser print-to-PDF as baseline. A client-side PDF library may be added only if reliable export is needed.
Persistence	For a single-device MVP, IndexedDB/local storage can be used only with a clear backup/export flow. Recommended production setup: Supabase Postgres + authentication + row-level security.
Deployment	Static hosting (e.g. Cloudflare Pages or Netlify) for frontend; Supabase only if cloud sync/authentication are required.
Architecture	Separate modules: settings, products, customers, invoice editor, calculation engine, invoice renderer, persistence and export/import.

Data safety decision

Invoices are business records. Do not rely on browser storage alone without explaining device-loss risk. If cloud sync is used, require authentication, enforce owner/staff permissions, enable database row-level security, and never expose service-role secrets in the frontend. Provide CSV/JSON backup and restore, plus a clear export path.

11. Suggested Data Model

Entity	Key fields
store_settings	id, trade_name, legal_name, address, state_code, phone, email, gstin, registration_status, logo_url, invoice_prefix, next_sequence, pricing_mode, tax_defaults, footer_text
products	id, name, sku, barcode, category, fabric, colour, hsn_code, unit, selling_price, gst_rate, active, stock_qty, created_at, updated_at
customers	id, name, phone, billing_address, state_code, gstin, business_name, notes, created_at
invoices	id, invoice_number, invoice_date, status, customer_id/snapshot, seller_snapshot, place_of_supply, supply_type, subtotal, discount_total, taxable_total, cgst_total, sgst_total, igst_total, round_off, grand_total, paid_total, balance_due, payment_status, notes, created_at
invoice_items	id, invoice_id, product_id nullable, description_snapshot, hsn_snapshot, qty, unit, unit_price, discount_type, discount_value, discount_amount, taxable_value, gst_rate_snapshot, cgst_amount, sgst_amount, igst_amount, line_total
payments	id, invoice_id, date, amount, method, reference, note
audit_events (optional)	id, actor_id, entity_type, entity_id, action, timestamp, summary

12. Invoice Status, Editing and Audit Rules

- Draft invoices can be edited or deleted by authorized users.
- Finalized invoices are immutable by default. Corrections should use a controlled void/cancel flow or a credit/debit note workflow only if the app explicitly supports it and the accountant approves the process.
- Never silently overwrite finalized invoice items when the catalogue price, HSN or tax rate changes. Store snapshots of item descriptions, price, HSN and tax values on the invoice.
- Duplicate-as-new must create a draft with a new future invoice number only on finalization; it must not copy the original invoice number.
- Record payment status as Unpaid / Partially Paid / Paid; support Cash, UPI, Card, Bank Transfer and Other as configurable payment methods. Do not imply a payment was received unless recorded.
- For returns/refunds, MVP may record a note and refer staff to the approved accounting process; do not improvise a GST credit-note feature.

13. Security and Reliability

- Authentication required for cloud-backed deployment. Use role-based access for admin and staff if more than one user exists.
- Use HTTPS; keep secrets server-side; apply database access policies and validate sensitive actions on the server.
- Confirm before finalizing, voiding or restoring backup. Prevent double-submission with idempotency or disabled submit state.
- Back up data and test restore. Exports should include invoices, line items, customers and settings without leaking secrets.
- Provide a clear error if saving/exporting fails; never display ‘Invoice saved’ until persistence confirms success.

14. Acceptance Criteria

ID	Acceptance test
AC-01	User can configure seller profile, registration status, address and invoice numbering.
AC-02	User can create a product with SKU, HSN, price and configurable GST rate.
AC-03	Product search works by name, SKU and barcode/keyboard-scanner input.
AC-04	User can add multiple products, edit quantities and apply valid item-level and bill-level discounts.
AC-05	Tax engine returns correct CGST/SGST or IGST according to configured transaction facts and pricing mode.
AC-06	Missing required tax information blocks GST invoice finalization with a helpful message.
AC-07	Registered and unregistered invoice modes display distinct, appropriate labels and do not charge GST in unregistered mode.
AC-08	Invoice PDF/print includes all configured seller, buyer, item, HSN, discount, tax and payment details.
AC-09	Invoice number is unique and sequential; finalization cannot create duplicates from double-clicks.
AC-10	History supports search/filter and opening a saved invoice; totals match the invoice document.
AC-11	App is usable at 360px mobile width and on desktop without horizontal page overflow.
AC-12	Backup export and restore are documented and tested for the chosen persistence approach.

15. Build Plan for Antigravity

Phase	Deliverables
1. Foundation	Create React + Vite + TypeScript project, responsive layout, brand tokens, navigation and typed domain models.
2. Settings & catalogue	Store settings, product CRUD, customer CRUD, validation and import/export.
3. Invoice engine	Pure money/tax calculation functions, tax mode selection, discount allocation and unit tests before building complex UI.
4. Billing UX	New invoice workflow, product search, line editing, customer selection, payment recording and draft handling.
5. Invoice document	HTML invoice template, A4 print CSS, PDF/print actions, amount in words and multi-page support.
6. History & persistence	Searchable invoice history, immutable finalization, backup/restore, auth/cloud persistence if chosen.
7. QA & release	Run calculation tests, responsive checks, PDF visual tests, error-state tests, security review and owner/accountant tax validation.

16. Instruction Prompt for Antigravity

Build the application described in this PRD as a production-minded, lightweight React + Vite + TypeScript web app for Shree Banarasi Sarees. Read this entire PRD before coding. First inspect the repository and reuse its conventions where sensible. Build the core billing workflow end-to-end instead of only producing a dashboard mockup. Prioritize correct and tested calculations, invoice data integrity, accessible responsive UI, and print/PDF quality. Keep GST rates, HSN values, seller registration status, invoice sequence and pricing mode configurable; never hardcode tax assumptions. Implement the calculation engine as pure functions with unit tests before wiring it to the UI. Use realistic empty states and clearly label demo data. Ensure all visible buttons work. Add a README with setup, configuration, data backup, deployment and tax-configuration caveats. Do not claim legal compliance without validation by the store's GST professional.

17. Release Checklist

- Owner confirms legal business name, address, GST registration status, GSTIN (if any), invoice sequence and logo.
- Accountant verifies applicable HSN codes, GST rates, place-of-supply behaviour, invoice fields and rounding.
- Test invoices against manually checked examples before live billing.
- Test PDF output on Chrome desktop and mobile; verify rupee symbol, page breaks and readable print contrast.
- Test data backup and restore on a second browser/device if cloud sync is not enabled.
- Train staff on draft vs finalized invoices, payment recording, corrections and data backup.

End of PRD • Prepared for implementation in Antigravity
